Maria Montessori (August 31, 1870 – May 6, 1952) was an Italian physician and educator best known for the philosophy of education that bears her name, and her writing on scientific pedagogy. At an early age, Montessori enrolled in classes at an all-boys technical school, with hopes of becoming an engineer. She soon had a change of heart and began medical school at a University in Rome, becoming one of the first women to attend medical school in Italy; she graduated with honors in 1896. Her educational method is in use today in many public and private schools globally.

In 1890, she enrolled in the University of Rome in a degree course in natural sciences, passing examinations in botany, zoology, experimental physics, histology, anatomy, and general and organic chemistry. This degree, along with additional studies in Italian and Latin, qualified her for admission into the medical program at the University in 1893. From 1896 to 1901, she worked with children experiencing some form of cognitive delay, illness, or disability. One of Montessori's many accomplishments was the Montessori method; a method of education for young children that stresses the development of a child's own initiative and natural abilities, especially through practical play. This method allowed children to develop at their own pace and provided educators with a new understanding of child development. Montessori's book, *The Montessori Method*, presents the method in detail. Educators who followed this model set up special environments to meet the needs of students in three age groups: 2–2.5 years, 2.5–6 years, and 6–12 years. The students learn through activities that involve exploration, manipulations, order, repetition, abstraction, and communication. Teachers encourage children in the first two age groups to use their senses to explore and manipulate materials in their immediate environment. Children in the last age group deal with abstract concepts based on their newly developed powers of reasoning, imagination, and creativity.

Read the following text then choose the correct answer:

Nanotechnology deals with the physical, chemical, and biological properties of structures and their components at Nano scale dimensions. There are one million nanometers in a millimeter. Nanotechnology tries to make materials or machines of that size. People are doing many different types of work in the field of nanotechnology. Most current work looks at making nanoparticles that have special properties, such as the way they scatter light, absorb X-rays, transport electrical currents or heat, etc. At the "science fiction" field there are attempts to make small copies of bigger machines. At the medical sector, as well, we can see the remarkable use of nanotech; for example the dentistry field. Dental nanorobots are able to move through teeth and surrounding tissues by using specific movement mechanisms.

Trousers and socks have been infused with nanotechnology so that they will last longer and keep people cool in the summer. Bandages are being infused with silver nanoparticles to heal cuts faster. There has been a lot of discussion about the future of nanotechnology and its dangers. Nanotechnology may be able to invent new materials and instruments which would be very useful, such as in medicine, computers, and making green electricity is helping design the next generation of solar panels, and efficient low-energy lighting. On the other hand, nanotechnology is new and there could

be unknown problems. For example, if the materials are bad for people's health or for nature. They may have a bad effect on the economy or even big natural systems like the Earth itself. Some groups argue that there should be rules about the use of nanotechnology. Science is presently undergoing a great evolution, taking humanity to a new era: the era of nanotechnology.
